Crystalline slurry

Crystal coat is the MacLennan crystalline slurry system

Crystal coat is applied to the concrete after it is poured and the formwork is struck. Additives are installed in concrete before it is poured so when defects occur the additives are of no benefit because they are in the concrete which has the defect, but it is the crack or defect that allows water through.

Because the Crystal coat is applied after the concrete is set but is normally still Green. It absorbs into the concrete and reacts with free lime to repair the defects by effectively filling them.

This system is effective, proven and acceptable to all major insurers.

Crystal coat is less expensive and more effective than additives and provides the first part of the MacLennan fully guaranteed waterproofing system.

Crystalline Slurry Application
